Table 2 shows the series of corresponding quarter growth rates as published.

The November 2023 publication (first row) shows the first estimate for all quarters from 2019 Q1 to 2023 Q2. The January 2024 publication (second row) shows the first estimate for 2023 Q3 and second estimate for all other quarters. Likewise, this publication, July 2024 (fourth row) shows the first estimate for 2024 Q1, second estimate for 2023 Q4, third estimate for 2023 Q3 and fourth estimate for all other quarters.

The revisions triangle can be read in different ways. By row, the table will show the series of quarterly rates as published at each release month. By column, the revisions triangle will show the revisions history of one specific quarter. Finally, the triangle can also be analyzed diagonally. The main diagonal includes all the first estimates of the quarters, the secondary column the second estimates, and so forth.

Table 3 provide the revisions indicators of corresponding quarter growth rates. Revisions indicators are calculated as descriptive statistics of a revision's history.

Each statistic aims at measuring a specific characteristic of the revision process. In general, direction, size, and dispersion of revisions are the most salient features of a QNA revisions process.

**a. Mean Revision (MR)** is a measure of direction of revisions. A MR value close to zero indicates that there are no directions in the revisions. When the MR is positive, the preliminary estimate is on average below the later estimate (downward bias); when the MR is negative, the preliminary estimate is on average above the later estimate (upward bias).

**b. Mean Absolute Revision (MAR)** is a simple average taken in absolute values. The MAR disregards the sign of revisions. It can be zero when positive, and negative revisions perfectly offset each other. The MAR is a measure of the size of revisions. The larger the MAR value is, the less reliable the preliminary estimate is compared with later ones.

**c. Standard Deviation of Revision (STDR)** is calculated as the standard deviation of growth rate. It is a measure of dispersion of revisions around the mean value. The smaller the STDR value, the closer are the revisions to the MR value. A high STDR value indicates large fluctuations in the reliability of early estimates between quarters.

**d. Range of Revision (RR)** is the difference between the maximum revision and the minimum revision. Always nonnegative, the RR value provides an immediate quantification of the spectrum of revisions occurred in the past.

**ROUNDING** Any discrepancies between totals and sum of components in this publication are due to rounding.

**UPDATING GDP** MBS releases three vintages of the current quarterly estimate for GDP: "Advance" estimates are released with a four month gap and are based on estimates or source data that are incomplete or subject to further revision by the source agency; "second" and "third" estimates are released with a seven months lag and a ten months lag, respectively, and are based on more detailed and more comprehensive data as they become available.

Annual and comprehensive updates are typically released in late September. Annual updates generally cover at least the 3 most recent calendar years (and their associated quarters) and incorporate newly available major annual source data as well as some changes in methods and definitions to improve the accounts.

Comprehensive (or benchmark) updates are carried out at about 5-year intervals and incorporate major periodic source data, as well as major conceptual improvements.
